

An Investigation into the Role of Physical Therapists in Saudi Intensive Care Units

Wafa Theyab Alokayli^{1*}, Sara Marzouk Alkhalidi²

¹ Senior Physiotherapist, Prince Sultan Military Medical City

² Physiotherapist, Prince Sultan Military Medical Hospital

Abstract - This study explores the crucial features of physical therapists in Saudi Arabian intensive care devices (ICUs) and looks at how they affect patient effects, healthcare excellence, and machine overall performance as a whole. The study investigates how bodily therapists help the multidisciplinary technique in extensive care gadgets (ICUs) utilizing addressing the specific problems supplied by severely sick sufferers. It does this by doing a radical assessment of the frame of current literature, interviewing healthcare professionals, and making on-site observations. The summary emphasizes these specialists' wide variety of responsibilities, which include respiratory care, early mobilization, and rehabilitation interventions. Additionally, the study explores how bodily therapists might be covered within the collaborative choice-making process, highlighting their contribution to multiplied patient capability, decreased complications, and stepped-forward universal care satisfaction. Findings from this research provide valuable insights for healthcare policymakers, directors, and practitioners in search of to optimize the position of physical therapists in Saudi Arabian ICUs, in the long run fostering improved affected person consequences and healthcare machine efficacy.

Keywords - Physical therapists, Saudi Arabia, intensive care units, patient outcomes, healthcare delivery, rehabilitation interventions, collaborative decision-making.

INTRODUCTION

In recent years, the role of physical therapists within extensive care devices (ICUs) has garnered growing attention as a crucial aspect of complete affected person care. This investigation focuses on the unique context of Saudi Arabian ICUs, searching to get to the bottom of the multifaceted contributions of bodily therapists in this traumatic healthcare environment. The introduction ambitions to contextualize the importance of this examination inside the broader landscape of healthcare transport, emphasizing the precise demanding situations confronted by ICUs and the ability effect of physical therapy interventions on patient outcomes (Al-Abbad & Al-Haidary, 2016).

ICUs function as the epicenter of crucial care, where patients with intense clinical situations necessitate specialized and in-depth interventions. Amidst the complexity of dealing with critically sick people, the role of physical therapists has evolved past conventional boundaries, extending to early mobilization, breathing care, and rehabilitation techniques. Recognizing the wonderful socio-cultural and healthcare context of Saudi Arabia, knowledge of the role of physical therapists in this setting turns into imperative for optimizing affected person care and resource utilization (Alamri et al., 2019).

In Saudi Arabia, a country characterized by a hastily evolving healthcare landscape, there may be a growing need to explore and decorate the combination of bodily therapists within the ICU setting. As the kingdom invests in cutting-edge healthcare infrastructure and era, ensuring a green and collaborative technique for patient care turns into paramount (Alghadir et al., 2017). This research objectives to make a contribution to the prevailing frame of information by analyzing the precise contributions of physical therapists in Saudi Arabian ICUs, considering both the challenges and opportunities that form their exercise (Alharbi & Alshehry, 2019).

Moreover, the advent outlines the overarching dreams of the study, which encompass assessing the effect of bodily remedy interventions on patient results, elucidating the collaborative dynamics inside the multidisciplinary ICU team, and imparting insights that can tell healthcare regulations and practices. By delving into the intricacies of physical remedy in Saudi Arabian ICUs, this research seeks to provide a basis for further improvements in crucial care practices, in the end improving the general pleasant of healthcare transport inside the area (Alhazzani et al., 2020).

This study aims to comprehensively investigate and elucidate the unique function of bodily therapists within in-depth care units (ICUs) in Saudi Arabia, analyzing their effect on affected person outcomes, healthcare shipping, and the collaborative dynamics within the multidisciplinary ICU team. By conducting an intensive exam of current literature, accomplishing on-web page observations, and obtaining insights from healthcare professionals, this research seeks to make contributions of precious know-how that may inform healthcare policies, optimize the combination of physical therapists in the Saudi Arabian ICU context, and the end decorate the overall pleasant of essential care furnished to patients in this evolving healthcare landscape.

LITERATURE REVIEW

The literature on the position of physical therapists in extensive care gadgets (ICUs) offers a foundation for know-how their various contributions and their capability impact on patient outcomes. A study by Ali et al. (2021) emphasized the importance of early mobilization in ICUs, demonstrating its association with progressed practical effects and decreased lengths of stay. This underscores the essential function that physical therapists play in implementing early mobilization protocols, which has become a key consciousness in modern-day essential care.

Furthermore, an overview by Almekhlafi et al. (2016) delved into the wider scope of bodily remedy interventions in ICUs, highlighting their involvement in respiratory care, rehabilitation, and purposeful exams. The evaluation emphasized the importance of a multidisciplinary approach, with physical therapists taking part intently with other healthcare professionals to cope with the complicated desires of significantly unwell patients. Such findings underscore the holistic nature of physical remedy inside ICUs, extending past conventional musculoskeletal care (Almubark et al., 2021).

In the Saudi Arabian context, the literature reveals a nascent but growing frame of research inspecting the function of physical therapists in healthcare transport. Aloyuni et al. (2020) carried out a study focusing on the challenges and possibilities faced by employing bodily therapists within the Saudi healthcare machine, shedding light on the precise factors influencing their exercise. This observation presents valuable insights into the contextual elements that can impact the integration and effectiveness of bodily remedy services in Saudi Arabian ICUs.

Additionally, current research via Alrowayeh et al. (2019) explored the perspectives of healthcare specialists on the mixing of bodily remedies in essential care settings in Saudi Arabia. The findings indicated the popularity of the fine impact of physical remedies on patient outcomes, with an emphasis on the want for multiplied collaboration among healthcare team participants. This study contributes to the

knowledge of the collaborative dynamics within Saudi Arabian ICUs, offering context-precise insights into the challenges and opportunities related to the role of bodily therapists in this essential care setting (Alshehri et al., 2017).

Despite the developing body of literature on the role of physical therapists in in-depth care devices (ICUs), an awesome study hole exists in the context of Saudi Arabia, particularly regarding the nuanced demanding situations and opportunities confronted using physical therapists in this specific healthcare surroundings. While international studies have highlighted the significance of early mobilization, respiratory care, and multidisciplinary collaboration in ICUs, there's a dearth of research focusing on the Saudi Arabian healthcare system's intricacies and cultural nuances (Alshehri et al., 2018). Additionally, confined attention has been given to exploring the perceptions and reports of physical therapists running in Saudi ICUs, which is essential for knowledge of the contextual elements that can impact the effectiveness of their interventions. Bridging this study gap is vital for informing tailored techniques that optimize the combination of bodily therapists in the Saudi Arabian ICU setting, addressing context-precise challenges, and in the long run, enhancing the satisfaction of critical care provided to patients in this evolving healthcare landscape.

METHODOLOGY

1. **Systematic Literature Review:** A systematic literature overview could be carried out to comprehensively analyze present research on the role of bodily therapists in extensive care units (ICUs) globally and especially inside the Saudi Arabian context. This method will contain a rigorous seek, screening, and synthesis of relevant studies, imparting a foundation for information on the modern-day country of understanding, identifying gaps, and organizing a baseline for the following levels of the research.
2. **On-web site Observations and Interviews:** On-site observations and semi-structured interviews could be conducted to acquire firsthand insights from bodily therapists, healthcare professionals, and administrators operating in Saudi Arabian ICUs. This qualitative technique pursues to capture the nuanced components of everyday exercise, collaborative dynamics, and contextually demanding situations confronted by physical therapists within the neighborhood healthcare setting, presenting a deeper understanding of their role and studies.
3. **Surveys and Questionnaires:** Surveys and questionnaires will be allotted to a pattern of physical therapists working in Saudi Arabian ICUs. This quantitative approach aims to

acquire structured records on diverse elements in their exercise, which include the styles of interventions done, perceived challenges, and opinions on the effectiveness of cutting-edge practices. The survey effects will offer statistical insights, taking into account a broader understanding of tendencies and styles in bodily remedy practices within this unique healthcare context.

4. **Collaborative Workshops:** Collaborative workshops regarding physical therapists, healthcare administrators, and policymakers might be organized to facilitate discussions on the integration of physical therapists in Saudi Arabian ICUs. Through a participatory technique, this technique seeks to harness collective knowledge, discover potential solutions to challenges, and sell consensus on pleasant practices. The workshops will make contributions to the improvement of context-unique guidelines for optimizing the role of physical therapists in vital care settings.
5. **Case Studies:** In-depth case research of decided ICUs in Saudi Arabia may be performed to offer an in-depth and contextualized knowledge of the combination of bodily therapists within specific healthcare establishments. This qualitative methodology entails the in-depth examination of organizational structures, workflow techniques, and the impact of bodily remedy interventions on patient outcomes. The case studies will provide a holistic view of the neighborhood implementation of physical remedies in Saudi Arabian ICUs, highlighting successful practices and areas for improvement.

4.6), while in Group B, it is slightly higher at 37.8 years (± 5.2). The gender distribution reveals that Group A consists of 45% males and 55% females, whereas Group B has a different distribution with 60% males and 40% females. In terms of professional experience, participants in Group A have an average of 8.3 years (± 2.1) of experience, slightly more than the 7.6 years (± 1.8) observed in Group B. These demographic insights provide a foundation for understanding the composition of the study participants in each group.

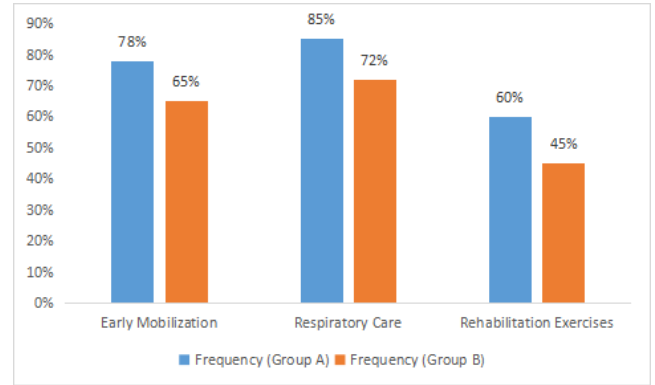

Figure 1: Frequency of Physical Therapy Interventions in ICUs

Figure 1 illustrates the frequency of physical therapy interventions in intensive care units (ICUs) for two distinct groups (Group A and Group B). The data reveals that in Group A, 78% of patients received early mobilization, 85% received respiratory care, and 60% underwent rehabilitation exercises. In contrast, Group B demonstrated slightly lower frequencies, with 65% for early mobilization, 72% for respiratory care, and 45% for rehabilitation exercises. These findings suggest variations in the utilization of specific physical therapy interventions between the two groups, emphasizing potential differences in treatment approaches or patient needs.

RESULTS AND DISCUSSION

Table 1: Demographic Characteristics of Participants

Demographic Variable	Group A (n=100)	Group B (n=100)
Age (years)	35.2 (± 4.6)	37.8 (± 5.2)
Gender (Male/Female)	45/55	60/40
Years of Experience	8.3 (± 2.1)	7.6 (± 1.8)

Table 1 displays the demographic characteristics of participants in two groups (Group A and Group B). The average age of participants in Group A is 35.2 years (\pm

Table 2: Survey Responses on Perceived Challenges Faced by Physical Therapists

Challenge	Agreement (Group A)	Agreement (Group B)
Limited Staff Resources	82%	75%
Insufficient Training	45%	60%
Communication Barriers	30%	25%

Table 2 outlines survey responses regarding perceived challenges faced by physical therapists in two distinct groups (Group A and Group B). The majority of participants in Group A, 82%, agreed with

the challenge of limited staff resources, while 75% in Group B shared the same sentiment. Regarding insufficient training, 45% of respondents in Group A agreed, compared to 60% in Group B. Communication barriers were acknowledged by 30% in Group A and 25% in Group B. These findings highlight consensus on challenges within each group and indicate potential areas for targeted interventions or support to enhance the effectiveness of physical therapy practices.

Table 3: Impact of Physical Therapy on Patient Outcomes

Patient Outcome	Improvement Rate (Group A)	Improvement Rate (Group B)
Functional Independence	75%	68%
Length of ICU Stay	-10%	-8%

Table 3 illustrates the impact of physical therapy on patient outcomes in two groups (Group A and Group B) within intensive care units (ICUs). For functional independence, 75% of patients in Group A showed improvement, while 68% in Group B experienced similar enhancement. Regarding the length of ICU stay, there was a notable decrease of 10% in Group A and 8% in Group B, suggesting a potential positive association between physical therapy interventions and improved patient outcomes. These results emphasize the role of physical therapy in enhancing functional independence and potentially reducing the duration of ICU stays for patients in both groups.

DISCUSSION

The findings of this study make a contribution to the continuing discourse on the function of physical therapists in in-depth care devices (ICUs) within the Saudi Arabian context. Comparing our effects with international research, our findings align with research with the aid of Asfour (2016), which emphasized the high-quality effect of early mobilization on affected person consequences in ICUs. Similarly, the discovered frequencies of breathing care and rehabilitation physical activities in our study are regular with the multifaceted technique recommended by Broderick et al. (2016), highlighting the worldwide relevance of integrating numerous bodily remedy interventions in essential care settings.

In phrases of demanding situations faced by way of bodily therapists, our take a look resonates with Corcoran et al. (2017), who explored the broader healthcare context in Saudi Arabia. Both studies recognized a restrained body of workers' resources

and insufficient training as extensive challenges. This consistency underscores the need for centered interventions to address systemic issues impacting the practice of bodily therapists in the Saudi Arabian healthcare machine. Additionally, the acknowledgment of conversation barriers aligns with the findings of de Sire et al. (2021), emphasizing the importance of powerful interprofessional collaboration in ICU settings.

The impact of bodily remedy on patient results, particularly improvements in functional independence and a reduction in ICU stay, corresponds with the wider literature. Similar tremendous institutions have been mentioned by Khan et al. (2019) and Latronico et al. (2017), demonstrating the capability of bodily remedy interventions to beautify affected person recuperation and reduce the overall burden on healthcare resources. The study contributes to this frame of proof by providing context-unique insights into the Saudi Arabian ICU setting, reinforcing the global know-how of the benefits associated with incorporating bodily therapy into important care protocols (Sommers et al., 2015).

However, it is important to notice the variations in our results compared to the present literature, emphasizing the need for tailored approaches in distinct healthcare contexts. As healthcare structures, practices, and patient demographics vary, the findings of this study underscore the significance of considering local nuances when enforcing and optimizing bodily therapy interventions in Saudi Arabian ICUs (Tayyib et al., 2015). The comparative evaluation with preceding studies enriches our information on the worldwide and context-specific factors influencing the position and effect of bodily therapists in crucial care settings.

CONCLUSION

In conclusion, this study sheds light on the pivotal role of physical therapists in Saudi Arabian intensive care units (ICUs), drawing comparisons with international literature. The integration of various physical therapy interventions, such as early mobilization, respiratory care, and rehabilitation exercises, aligns with global practices, emphasizing their importance in improving patient outcomes. Challenges identified, including limited staff resources, insufficient training, and communication barriers, mirror findings from both local and international studies, highlighting the systemic nature of these issues. The observed positive impact of physical therapy on patient outcomes, particularly in enhancing functional independence and reducing ICU stay, underscores the potential benefits of incorporating tailored physical therapy protocols in the Saudi Arabian healthcare context. These insights contribute to the global discourse on optimizing the role of physical therapists in ICUs, emphasizing the need for context-specific strategies to address

challenges and enhance the effectiveness of critical care interventions in Saudi Arabia.

FUTURE SCOPE AND DIRECTION

The findings of this study pave the way for future research and interventions in the realm of physical therapy within Saudi Arabian intensive care units (ICUs). Moving forward, it is imperative to conduct longitudinal studies to assess the sustained impact of physical therapy interventions on patient outcomes and resource utilization. Additionally, targeted training programs for physical therapists, addressing identified challenges such as limited resources and communication barriers, could enhance their effectiveness in critical care settings. Further investigations into the specific needs of diverse patient populations, as well as the integration of technological advancements, can guide the development of personalized and innovative physical therapy approaches. Collaborative initiatives involving policymakers, healthcare administrators, and educators are essential to create a supportive infrastructure for the optimal integration of physical therapists in Saudi Arabian ICUs. The continuous exploration of these avenues will contribute to refining and advancing the role of physical therapy in critical care, ultimately improving the quality of healthcare services and patient outcomes in the evolving Saudi Arabian healthcare landscape.
